

ENDPOINT SECURITY ASSESSMENT

Malware Investigation Report

Threat Detection & Endpoint Analysis

REPORT DATE

June 12, 2026

REPORT ID

SEC-2026-P3-001

ANALYST

AbdxIrahman

STATUS

✓ Investigation Closed

THREAT LEVEL

LOW — No Malware Found

SYSTEM

Windows 11 — AbdxIrahman-PC

System: Clean

0 / 61 Threats Detected

5 Steps Completed

1 EXECUTIVE SUMMARY

A comprehensive endpoint security assessment was conducted on the workstation **Abdylrahman-PC** running Windows 11. The investigation encompassed process monitoring, startup persistence analysis, live network traffic review, malware file scanning via VirusTotal, and Windows Security Event Log analysis. The assessment was performed on **June 12, 2026** in response to a routine threat-detection exercise under Project 3 of the Cybersecurity Internship Program. No active threats, malicious processes, Command and Control (C2) communications, or Indicators of Compromise (IoCs) were discovered. The system was confirmed to be in a healthy and secure state.

0

MALICIOUS PROCESSES FOUND

0

SUSPICIOUS CONNECTIONS

0/61

VIRUSTOTAL DETECTIONS

2 INVESTIGATION OBJECTIVE

The purpose of this investigation was to:

- Monitor all active processes on the endpoint and identify any running from unusual or suspicious directories.
- Review startup programs for unsigned or unknown persistence mechanisms typically used by malware.
- Analyze live network connections to detect Command and Control (C2) communication or data exfiltration activity.
- Perform a hash-based file scan on collected artifacts using the VirusTotal intelligence platform.
- Review the Windows Security Event Log for Audit Failure events or unauthorized access attempts.

3STEP 1 — PROCESS MONITORING

Tool Used: Windows Task Manager | Date: June 12, 2026

PROCESS NAME	CPU USAGE	MEMORY	FILE LOCATION	VERDICT
Microsoft Edge	0.3%	879.2 MB	C:\Program Files\...	✓ SAFE
Task Manager	2.2%	101.0 MB	C:\WINDOWS\system32\	✓ SAFE
Windows Explorer	0.3%	142.4 MB	C:\WINDOWS\	✓ SAFE
Antimalware Service	0%	6.8 MB	C:\WINDOWS\system32\	✓ SAFE
ColorEngine (Samsung)	0%	1.0 MB	C:\Program Files\Samsung\	✓ SAFE
DAX API (Intel)	0%	4.7 MB	System Service	✓ SAFE

Finding: No Suspicious Processes Detected

All active processes were verified against known-safe Windows system paths and OEM software directories. No processes were found running from C:\Users\...\AppData\Local\Temp or other suspicious locations. No CPU or memory anomalies indicative of a cryptominer or rootkit were observed.

4STEP 2 — STARTUP PERSISTENCE ANALYSIS

Tool Used: Windows Task Manager → Startup Apps Tab | Date: June 12, 2026

APPLICATION	PUBLISHER	STATUS	IMPACT	VERDICT
Microsoft 365 Copilot	Microsoft Corporation	Enabled	Not Measured	✓ LEGITIMATE
msedge	Microsoft	Enabled	Low	✓ LEGITIMATE
OneDrive	Microsoft	Enabled	High	✓ LEGITIMATE
OneDriveSyncService	Microsoft	Enabled	High	✓ LEGITIMATE
SecurityHealthSystray	Microsoft	Enabled	Low	✓ LEGITIMATE
Quick Share (Samsung)	Samsung Electronics	Enabled	Not Measured	✓ LEGITIMATE
TranslucentTB	Charles Milette	Enabled	Not Measured	⚠ VERIFIED — 3RD PARTY

Finding: No Malicious Persistence Mechanisms Detected

All startup entries were reviewed. TranslucentTB (Charles Milette) is a well-known, open-source Windows taskbar customization tool and does not pose a security risk. No registry run-key hijacking, unsigned executables, or unknown auto-start entries were discovered.

5 **STEP 3 — NETWORK TRAFFIC ANALYSIS**

Tool Used: netstat -ano (PowerShell) | **Date:** June 12, 2026

LOCAL ADDRESS	FOREIGN ADDRESS / IP	PORT	STATE	PID	VERDICT
192.168.1.9	13.204.106.34	443	ESTABLISHED	5016	✓ SAFE (HTTPS)
192.168.1.9	57.144.122.145	443	ESTABLISHED	17632	✓ SAFE (HTTPS)
192.168.1.9	172.188.155.25	443	ESTABLISHED	17632	✓ SAFE (HTTPS)
192.168.1.9	34.54.84.110	443	ESTABLISHED	15772	✓ SAFE (HTTPS)
127.0.0.1	127.0.0.1 (Local)	Various	ESTABLISHED	Various	✓ LOCALHOST IPC

Finding: No C2 Communication or Data Exfiltration Detected

All external connections were operating over Port 443 (encrypted HTTPS). No connections to known malicious IP ranges or blacklisted domains were observed. PID cross-referencing confirmed all connections belonged to Microsoft Edge, OneDrive, and Antigravity (legitimate software). No unusual high-volume outbound data transfers were detected.

6 **STEP 4 — VIRUSTOTAL FILE SCAN**

Tool Used: VirusTotal.com | **Date:** June 12, 2026

File Scanned:

active_connections.txt

SHA-256 Hash:

cd1c812f78a36f0cf1f47b23bb5fba102bebbf2768de4a6d6a630ae0
4121b850

File Size: 17.83 KB

File Type: PowerShell Text / Network Log

0

/ 61 Security Vendors

No security vendors flagged this file as malicious

✓ CLEAN FILE

7 STEP 5 — WINDOWS EVENT LOG ANALYSIS

Tool Used: Windows Event Viewer → Windows Logs → Security | Date: June 12, 2026

EVENT ID	EVENT NAME	SOURCE	LEVEL	VERDICT
4672	Special Privileges Assigned to New Logon	Microsoft Windows Security	Information	✓ NORMAL
4627	Group Membership Information	Microsoft Windows Security	Information	✓ NORMAL
4624	An account was successfully logged on	Microsoft Windows Security	Information	✓ NORMAL
5379	Credential Manager credentials were read	Microsoft Windows Security	Information	✓ NORMAL

Finding: No Security Breaches or Unauthorized Access Detected

24,840 security events were reviewed. All logged events were "Audit Success" type. No Event ID 4625 (Failed Login / Brute Force Attack) events were present. The SYSTEM account was the security principal logged in Event 4672, which is standard behavior for the Windows kernel during boot.

8 INDICATORS OF COMPROMISE (IOC) SUMMARY

	Suspicious File Hashes	NONE FOUND
	Malicious IP Addresses	NONE FOUND
	Abnormal Processes	NONE FOUND
	Suspicious Registry Keys	NONE FOUND
	C2 Communication	NONE DETECTED
	Suspicious Startup Entries	NONE FOUND

9 RECOMMENDATIONS

1 Maintain Windows Defender Real-Time Protection

Ensure Windows Defender definitions are updated daily to detect the latest known malware signatures and zero-day threats.

2 Enable Advanced Audit Policies

Configure Windows to log Process Creation events (Event ID 4688) to detect future attempts to run malicious executables from temp directories.

3 Conduct Routine Endpoint Sweeps

Schedule monthly automated threat-hunting scans using this methodology to ensure continued compliance and early threat detection.

4 Maintain Firewall Rules

Continue enforcing inbound traffic restrictions via Windows Defender Firewall. Consider blocking all non-essential inbound ports.

5 Apply All Pending Windows Updates

Regularly apply OS and application security patches to eliminate known privilege escalation and remote execution vulnerabilities.

10 CONCLUSION

After conducting a thorough five-step endpoint investigation on **June 12, 2026**, this analyst concludes that the workstation **Abdylrahman-PC** (Windows 11) is **free from any malware infection, unauthorized access, or active compromise**. All processes, startup entries, network connections, file hashes, and security events were reviewed and verified as legitimate. The system's security posture is assessed as **GOOD**. No immediate remediation actions are required.

Final Risk Rating: LOW

The endpoint poses no immediate risk. Continued adherence to the recommendations listed in Section 9 will maintain this security posture going forward.
